

NordInsight delivers breakthrough tech to be tested at North Zealand Hospital

In NordInsight we have developed a next-gen implant database that enables radiographers and radiologists to - quickly and safely - find MRI-safety protocols for MRI-scan patients with implants. A task that up until now has been cumbersome and unreliable. The new solution will free up hundreds of work hours and make radiographers more confident in their work. As the first hospital in the world, North Zealand Hospital will be testing the breakthrough solution.

From September 2022 NordInsight will be collaborating with North Zealand Hospital on developing the implant database for radiographers and radiologists. The solution frees up significant working hours so radiographers and radiologists can focus on the patients. At the same time, the tests can help refine and tailor the solution to create maximum value for hospitals all over the world.

“North Zealand Hospital is well-known for their commitment to innovation, and they want to make sure that they offer the best possible care for their patients. However, it’s hard to get permission to test and develop solutions at hospitals. Therefore, we were delighted to get the crucial help from Nordic Health Lab who matched our solution with North Zealand Hospital. The aim of Nordic Health Lab is to build bridges between private companies and the public health care system. For us, collaborations with both private and public actors are important steps towards our goal of bringing state-of-the-art software into hospitals across the globe,” says Simon Elliott Thomassen, Co-founder & CEO of NordInsight.

About NordInsight’s solution:

Radiographers spend between 10-120 minutes a day searching for MRI safety guidelines, and huge amounts on Google-searches. NordInsight’s solution is a de-risk patient safety for MRI-scans. With advanced browser-based implant database. That way, leading hospitals all over the world can scan with confidence. The solution also provides a better patient experience and less stress.
